Summary

Backend software engineer specializing in Go and T-SQL, building mission-critical scheduling systems for first responders – with a verification-first, AI-assisted engineering practice woven into daily development.

Experience

Backend Software Developer, Jivasoft, San Antonio, TX | Feb 2024 - Current

Design, build, and maintain backend systems for a first-responder scheduling platform – the first in production to unite extra-duty and on-duty scheduling in a single system – as a core contributor to its rebuild from legacy .NET into Go and SQL Server.

Built workflows serving every side of the platform: officer-facing tools for finding, working, and getting paid for jobs; supervisor tooling for scheduling, staffing, and event coordination; and admin workflows governing positions, assignments, and time-off – the daily operating surface for agencies and their officers.

Delivered 15+ production workflows that on-duty and extra-duty officers rely on every day, ten of which shipped together in a single production release.

Junior Field Engineer, GR Energy Services, Pleasanton, TX | 2017 - 2021

Led a wireline crew performing pump-down perforation operations alongside hydraulic fracturing, managing high-stakes work under tight timelines and strict safety and regulatory compliance.

AI-Assisted Engineering

Completed a company-sponsored AI engineering curriculum applied to live production tickets under real review pressure, with top marks across every assessment: an 18-module Agentic Engineering program, a 16-module Claude Code specialization, and the Hypr Framework course on assessing a codebase's patterns and generating specialized agents.

Education

University of Texas, San Antonio – B.S. in Computer Science | GPA: 3.98

Panola College, Carthage – A.A.S. in Petroleum Technology | GPA: 3.84

Skills

Tech Stack: Go, T-SQL / SQL Server, Python, JavaScript (React)

Tools & Platforms: GitHub & GitHub Actions, Jira, Docker, SSMS, VS Code

AI Tooling: Claude Code, GitHub Copilot, ChatGPT, MCP, custom agent authoring

Work Projects

Combined Scheduler and Action Items

The officer's combined schedule: a calendar of assigned and upcoming jobs with per-job action workflows – view full job details, transfer a job by releasing it to the pool or offering it directly to another officer as an expiring pending request, and cancel a picked-up job under agency-configured cancellation policy.

Available Jobs

Browse-and-search experience for open job slots with map locations, date filtering, and agency-local times. Whether an officer can take a job outright or must request it is driven by agency self-assign configuration, with multi-slot requests and a per-agency "request all" option for claiming every opening on a job at once.

Split Job

Designed and delivered a full CRUD workflow letting an officer divide a job into sequential, time-boxed segments and hand trailing segments off to another officer – governed by per-agency configuration controlling how much of a job the original officer can give away. Supports multi-officer capacity, session-backed in-progress edits, and segment-level validation.

Check-In / Check-Out

Delivered the officer time-verification experience: check in and out of jobs with agency-configured custom questions, verify or correct submitted hours within a grace window, and report no-shows or canceled-with-minimum jobs – all behavior driven by per-agency configuration rather than code changes.

Job History

The officer's complete work record – dates, verified times, paid hours, pay, and status from Scheduled through Paid. Unverified work always surfaces regardless of date filter, so nothing worked goes unpaid.

Event Management

Built supervisor scheduling tooling that groups jobs under a parent event – a multi-day festival with dozens of positions, managed as one unit. Covers event create/edit/clone, per-event job lists and rosters, officer messaging, and direct officer assignment that bypasses the self-service pickup pool.

Admin Scheduling Suite

Administrative tooling that proxies directly into each agency's on-duty scheduling database: define positions with expiring qualification requirements and schedules, maintain officers' standing permanent assignments with rank validation and priority ordering, set per-unit time-off restriction levels by calendar date, and run instant leave-balance checks per employee.

Personal Projects

AI Food Decision Companion

Conversational AI companion that eliminates food decision fatigue: users text it over WhatsApp like a friend and get one confident recommendation – cook, order, leftovers, or a nearby restaurant – in under a minute. Built on persistent memory: it learns from acceptances and vetoes, tracks recent meals to avoid repetition, and personalizes with every exchange instead of starting cold.

Tech: Python, FastAPI, OpenAI API, Twilio WhatsApp

School Projects

Trading Card Website

Developed a responsive trading card management website with dynamic filtering and user accounts. Led weekly scrum meetings to drive team collaboration and ensure timely delivery.

Tech: React, Java Spring Boot, MySQL – Course: Software Engineering

Cybersecurity Awareness Website

Built and hosted a cybersecurity education website on AWS, featuring tools like a password generator and security checklist to promote best practices.

Tech: AWS, HTML/CSS, JavaScript, PHP, MySQL – Course: Web Technologies

Time Series Forecasting and Sentiment Analysis

Conducted sentiment analysis on social-media data using BERT, paired with time-series forecasting of equity prices.

Tech: Python, Time Series Prediction, BERT – Course: Artificial Intelligence
